

MediSphere AI

Clinical intelligence for hospitals that operate in many countries.

One audited sign-in gives each role the right tools: guideline answers with sources, AI triage with early-warning scoring, a live emergency queue and FHIR-ready records for four hospital sites in four languages.

Deployment

Built for real operations

- 9-step intake: validate, mask, triage, route, save, schedule, draft messages, draft note, audit
- Per-site data isolation and local emergency numbers
- Patient reports analysed in memory, never stored

Safety and security

- 5 roles with least-privilege access
- Hash-chained audit trail that detects tampering
- Lockout, rate limits, signed expiring sessions, optional field encryption

Honest by design

- Abstains when evidence is weak
- Never gives personal drug doses
- Decision support only; needs clinical validation before patient use
